KALEIDO DELIVERS ALL-AROUND GLYCAEMIC CONTROL IN THE REAL-WORLD

Best-in-class time below range with the lowest glycaemic variability – no compromise on strong time in range

REAL-WORLD EVIDENCE (RWE)

- Analysis of nearly 4,000 adults across Germany, Netherlands and France living with type 1 diabetes
- No eligibility or exclusion criteria; no selection bias

72.2%

TIME IN RANGE
MEDIAN

Meets $\geq 70\%$ consensus target^{1,3,4}

1.23%

TIME BELOW RANGE
MEDIAN

Best-in-class published in real-world^{1,2}

28.7%

COEFFICIENT OF VARIATION
MEDIAN

Lowest published CV data in the real-world^{1,2}

PRECISION WITH EVERY DOSE

Proprietary valve micro-dosing mechanism for precise, non-pressurised, and consistent delivery

- Reproducible insulin delivery at the lowest bolus dose⁵
- Basal and bolus dose accuracy within $\pm 5\%$ of target⁶

MINIMISED HYPOGLYCAEMIA

Greater glucose stability may lead to fewer lows

- 1.23% time below 70 mg/dL (3.9 mmol/L); only 18 mins per day¹
- 0.21% time spent below 54 mg/dL (3.0 mmol/L); only 3 mins per day¹

Fewer
glycaemic swings,
minimising
immediate safety risk
and
day-to-day
patient burden

The smallest, lightest, and most precise insulin patch pump in its class*

- Discreet, personalized form factor weighs only 19 grams
- Integrated with Dexcom G7
- Smartphone Control
